## Appendix III

## 3,6-Di-2-pyridylpyrrolo[3,4-c]pyrrole-1,4(2H,5H)-dione

 ortho-DPPP: Phase I
#### Abstract

The title compound, $\mathrm{C}_{16} \mathrm{H}_{10} \mathrm{~N}_{4} \mathrm{O}_{2}$, is an organic red pigment utilized for $\mathrm{H}_{2}$ gas sensors. The asymmetric unit contains two half-molecules, each molecule being centrosymmetric. The two independent centrosymmetric diketopyrrolopyrrole moieties are connected by $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds to form a ribbon structure along [100]. The molecules are stacked in a 'hunter's fence' fashion (viz. when viewed from the side, molecules, slipped by about $70^{\circ}$ within molecular stacks, cross each other in a fence-like structure) along the $b$ axis.

## Comment

Diketodiphenylpyrrolopyrroles are industrially important red pigments (Herbst \& Hunger, 1993). The title compound, (I) (o-DPPP), is a dipyridyl derivative whose N atom of the pyridyl ring is located at the ortho site. There are also meta and para derivatives. Among these, only $p$-DPPP was found to exhibit a high proton affinity due to the N atom of the pyridyl ring (Mizuguchi, 1993). Because of this, $p$-DPPP has recently attracted attention as a high-performance $\mathrm{H}_{2}$ gas sensor (Takahashi \& Mizuguchi, 2005). In phase I of $p$-DPPP, there are $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ bifurcated hydrogen bonds between the NH group of one molecule and the O atom of the neighboring one and the two N atoms of the pyridyl rings remain free (i.e. unbonded) to accept protons necessary for $\mathrm{H}_{2}$ gas sensors (Mizuguchi et al., 2005). There is also phase II of $p$-DPPP which is rather insensitive to protons because one N atom of the two pyridyl rings is blocked by $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds (Mizuguchi et al., 2002). The purpose of the present investigation was to analyze the crystal structure of o-DPPP

(I)
in order to account for its poor sensitivity to protons.
There are two independent half-molecules A and B in the asymmetric unit (Fig. 1). Molecules A and B are centrosymmetric but not entirely planar. The angles between each pyridyl ring and the heterocyclic ring systems are 10.9 (2) ${ }^{\circ}$ in molecule A and $1.8(2)^{\circ}$ in molecule B. As shown in Fig. 2, there are $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ intermolecular hydrogen bonds (Table 2). There are chains of $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ intermolecular hydrogen bonds between the NH group of one molecule and the N of the pyridyl ring of the neighboring one along the $a$ axis. However there are two kinds of chains; one is composed of only molecule A and one of only molecule B. This are designated A and B in Fig. 2. Fig. 3 is the projection on to the $b c$ plane, showing how molecules A and B are differently stacked along the $b$ axis.

A

Figure 1
A view of the molecular structure of (I), showing $50 \%$ displacement ellipsoids for non- H atoms. The unlabeled atoms in molecules $A$ and $B$ are related by the symmetry codes $(1-x, 2-y, 1-z)$ and $(1-x, 1-y, 1-$ $z$ ), respectively.

## Experimental

$o$-DPPP was synthesized according to the method reported previously by Rochat et al. (1986) and purified three times by sublimation using a two-zone furnace (Mizuguchi, 1981). Single crystals of o-DPPP were grown from the vapor phase in a closed system based on a two-zone furnace. After 48 h , a number of single crystals were obtained in the form of platelets.

Figure 2
Molecular arrangement of (I), showing $\mathrm{N}-\mathrm{H}^{\cdots} \mathrm{N}$ intermolecular hydrogen bonds as dotted lines.

Projection of the structure of (I) on to the $b c$ plane.

## Crystal data

$\mathrm{C}_{16} \mathrm{H}_{10} \mathrm{~N}_{4} \mathrm{O}_{2}$
$M_{r}=290.28$
Monoclinic, $P 2 / a$
$a=16.097$ (2) $\AA$
$b=3.7144$ (5) $\AA$
$c=21.725(2) \AA$
$\beta=110.758(7)^{\circ}$
$V=1214.6(3) \AA^{3}$
$Z=4$

## Data collection

Rigaku R-AXIS RAPID Imaging
Plate diffractometer
$\omega$ scans
Absorption correction: multi-scan
(Higashi, 1995)
$T_{\text {min }}=0.292, T_{\text {max }}=0.835$
9996 measured reflections
$D_{x}=1.587 \mathrm{Mg} \mathrm{m}^{-3}$
$\mathrm{Cu} K \alpha$ radiation
Cell parameters from 9840 reflections
$\theta=2.9-68.4^{\circ}$
$\mu=0.90 \mathrm{~mm}^{-1}$
$T=93.2 \mathrm{~K}$
Platelet, red
$0.60 \times 0.20 \times 0.20 \mathrm{~mm}$

2028 independent reflections
1647 reflections with $F^{2}>2 \sigma\left(F^{2}\right)$
$R_{\text {int }}=0.079$
$\theta_{\text {max }}=68.3^{\circ}$
$h=-19 \rightarrow 19$
$k=-3 \rightarrow 3$
$l=-25 \rightarrow 25$

## Refinement

Refinement on $F^{2}$
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.091$
$w R\left(F^{2}\right)=0.346$
$S=1.91$
2028 reflections
199 parameters
H -atom parameters constrained
$w=1 /\left[\sigma^{2}\left(F_{o}{ }^{2}\right)+\left\{0.149\left[\operatorname{Max}\left(F_{o}{ }^{2}, 0\right)+2 F_{c}{ }^{2}\right] / 3\right\}^{2}\right]$
$(\Delta / \sigma) \max =0.012$
$\Delta \rho_{\text {max }}=0.68$ e $\AA^{-3}$
$\Delta \rho_{\text {min }}=-0.47$ e $\AA^{-3}$
